Recombinant "Paper" Plasmid Background: Many bacteria contain plasmids, small independent DNA fragments that carry specific pieces of genetic information, such as resistance to specific antibiotics or other genetic characteristics. Plasmids can be transmitted from one bacterium to another, or from the environment into a host

Recombinant Paper Plasmids Cut-and-Paste Biotechnology
Recombinant plasmids containing poxc and poxalb promoters extending about 1400 nucleotides upstream of the ATG had been previously selected from the genomic P. ostreatus DNA library (1, 3, 4). These plasmids were used as templates for PCR reactions to amplify probes to be used in electrophoretic mobility shift assays.

We will use paper plasmid DNA models to go through the process that scientists use when making recombinant DNA. Scissors will substitute for restriction enzymes. The enzyme DNA ligase, which forms phosphodiester bonds between pieces of DNA, is represented by Scotch tape. Our re sult will be a model of a recombinant DNA molecule.

While not technically a lab notebook—one containing a log of daily experiments—the notebook contains extra information on experiments, many sketches and maps of recombinant plasmids, and outlines for papers to be published (including on p. 51 the “Outline for Recombination Paper” that would become the paper “Construction of Biologically Functional Bacterial Plasmids In Vitro” published in the Proceedings of the National Academy of the Sciences in 1973.)

Recombinant DNA and the Birth of Biotech -- Recombinant ...
It is also very common to use a recombinant plasmid to express large amounts of a known gene to obtain RNA or protein from it. Such recombinant gene expression has been indispensable for the biotechnology industry. Many bacteria contain plasmids. Recombinant plasmids were first developed in the lab rat of the bacterial world, Escherichia coli. Many other types of bacteria can harbor such plasmids.

What is a Recombinant Plasmid? (with pictures)
Recombinant DNA in a living organism was first achieved in 1973 by Herbert Boyer, of the University of California at San Francisco, and Stanley Cohen, at Stanford University, who used E. coli restriction enzymes to insert foreign DNA into plasmids.

Recombinant DNA Technology- Steps, Applications and ...
Recombinant DNA molecules are pieces of DNA that have been reassembled from pieces taken from more than one source of DNA. Often, one of these DNA sources is a plasmid. Plasmids are small, circular DNA molecules that can reside in cells.

Recombinant Paper Plasmids - bitofnews.com
The common method used for genetically modifying bacteria is to use recombinant plasmids. Plasmids are circular pieces of DNA; when placed near bacteria, the plasmid is absorbed and incorporated into the bacterial cell. Once inside the bacteria, the plasmid is treated the same as the bacteria's original DNA.

Plasmid vectors Recombinant DNA technology is an essential method for bringing about desirable changes in the DNA of organisms. Going over the process briefly – DNA fragments from one organism are added to a segment known as vector DNA, which leads to the formation of recombinant DNA.

Plasmid: Definition, Types, Function and Significance
Plasmids often contain genes for resistance to antibiotics. Plasmids carrying genes for ampicillin and kanamycin resistance are assembled and the two plasmids are recombined. The plasmid with ampicillin resistance is called as pAMP, the plasmid with kanamycin resistance as pKAN, and the recombinant plasmid as pAMP/KAN.

plasmids. Plasmids are a wonderfully ally for biologists who desire to get bacteria to produce very specific proteins. The plasmids conveniently can be cut, fused with other DNA and then reabsorbed by bacteria. The bacteria easily incorporate the new DNA information into their metabolism. This “recombining” of DNA is called RECOMBINANT DNA.

The E. coli Insulin Factory - BIOLOGY JUNCTION
In order to be useful, the recombinant DNA molecules have to be made to replicate and function genetically within a cell. One method for doing this is to use plasmid DNA from bacteria. Small DNA fragments can be inserted into the plasmids, which are then introduced into bacterial cells. As the bacteria reproduce, so do the recombinant plasmids.
